

• Suppose that X is a geometric random variable and draw a tree diagram that illustrates how the benrhoulli trials that compose this random variable pan out for X = 1, X = 2 and X = 3

• Assuming that the probability of success in each individual trial is equal to p write out expressions for P(X = 0), P(X = 1), P(X = 2) and P(X = 3) if X is a geometric random variable.

• Write out an expression for the geometric random variable.

• Explain what range of values a geometric random variable X can take.
